

# NIS Backup & Restore

## Secure Backups and Recovery Plans

The key to ensuring your business survives any potential breakdown in your security or any physical failure of key components is by using world class backups of your data and systems.

Having got your information backed up it is essential that you are able to recover as quickly as possible. There is little point having your data somewhere that will take days to recover and restore.

NIS provides backup solutions to suit all your data needs, including protecting the often overlooked backup of cloud based e-mail and documents.

We provide critical server backups running every 15 minutes and can replicate the data in our secure datacentres. Depending on your requirement this can be extended to include business continuity servers available either in a Cold Standby mode or Hot Standby mode depending on how quickly you would need your server to be available should the worst happen.

If the very worst happens and all your devices are corrupted by, for example, a Ransomware attack then we have partnered with specialists in forensic recovery and advanced data recovery and can provide Expert Witness services if the need should arise. Clearly the objective is to not make use of this service!
