

NIS Health

Health Checks and Virus Removal

To ensure you understand what your systems look like from a Cyber Security perspective, we carry out an initial free health check after which you can choose from our catalogue of further health checks to identify in detail the health of your network and devices, vulnerabilities, and potential ingress points.

Completed over several days this low cost service provides a very detailed report of every device on your network with recommendations of remedial actions required; for example what server or device patches are required and any AV issues.

In addition we deploy tools to examine what the Dark Web knows about your network and use this to help target our recommendations.

We would start any engagement with a client regarding Cyber Security with a full detailed health check.

This security scanning forms part of the enhanced NIS Monitor service and will include monitoring the Dark Web for details regarding your company that could have a negative impact on your security and give you those recommendations in near real time.
