

NIS Monitor

Continual Monitoring and Intervention

NIS has always prided itself on being able to offer clients with the option of proactive system and network monitoring to ensure all components of a company's infrastructure are operating within acceptable performance tolerances and to warn of potential and actual hardware failures.

This can be extended to include Cyber Security monitoring to ensure our clients and staff react immediately to threats detected – be it devices failing to update their security packages or a new device being detected that is not expected.

These monitoring services continually adapt and are designed to search out the most advanced threats.
